Energy and Low Carbon Green Growth

On August 15th 2008, the Korea government declared "Low Carbon Green Growth" as a new vision for national development.

Green Growth refers to optimization of synergy created from the virtuous cycle of Environmental (Green) and economic (Growth) interactions. In other words, it is a concrete policy solution to establish advanced society by making economic growth patterns more environmental friendly.

As a national development vision, the scope of Green Growth not only covers energy and environmental issues but also extends to creating new jobs and securing new growth engine, building industry competitiveness, efficient land use and revolutionizing our lives. Green Growth is a sustainable development that reduces GHG emissions and pollutions. It is a new national development paradigm that creates new jobs and national growth engines through green technology and clean energy.

Energy efficiency improvements and the dissemination of new and renewable energy are core contents of Low Carbon Green Growth.
